

ABSTRACT

Nowadays technology has developed rapidly so that human needs in finding or accessing information will be made easier. Now technology in the field of information has many types that are continuously progressing, for example information technology in the field of education.

Currently, there are still many academic units that collect data Google form and whatsapp media, therefore a web-based academic administrative information system is needed. In this final project the author will develop an academic administration web using PHP programming with the Laravel framework.

The results of this website will make it easier to collect data in the academic field such as requests for data by lecturers, submissions for extension of SKTA, submissions to move study programs, and the like. The design of this web can be easily understood and used continuously to save time in the data collection process.

Based on the results of a questionnaire from 30 respondents which are the students in the Faculty of Electrical Engineering of Telkom University, average from the responses are agree that the submission of academic administrative services via the web is quite feasible to use and it can be concluded that this research can help students in the Faculty of Electrical Engineering of Telkom University, in order to apply for academic services on campus practically.
