

## **ABSTRACT**

Website is an information medium that offers various conveniences in presenting information. Speed and convenience are positive values of the internet. Information technology is developing along with the increasing needs of the community. The creation of this website uses CodeIgniter and MySQL as its data base. The website that will be designed later consists of several pages including the main page, student data, input of student payment receipts, and reports on student payment proofs. The design of this website is done completely so that it can cover all needs. The expected result of this website is to be able to provide information quickly and accurately. By using this system, the collection of lecture financial reports can be monitored in real time using a website-based application and makes it easier to enter data automatically when making reports on proof of tuition payments.

***Keywords:*** *Website, CodeIgniter, MySQL, Information, Students.*
