ABSTRACT

The development of technology is increasingly helping a job more efficiently. Many companies have not implemented a computerized system for recording goods, such as recording outgoing goods, stock quantities, stock updates, so that they are less effective and have a lower level of accuracy because they only rely on existing human resources while the stock of goods is very large.

The purpose of this research is to make the recording of goods more effective, efficient, and accurate by using a website. Website developed using codeigniter 4 and MySQL database.

Keywords: monitoring system, database, MySQL, Website.
