ABSTRACT

This research aims to facilitate teachers and students in carrying out learning activities - teaching online. Today's technology could help ease human work. However, technological developments today are still less optimized, especially for learning media. In the school environment itself, there are still frequent shortcomings in delivering materials, assignments and lesson values. In this case, a method of preparation was made in this research, namely by conducting a survey to teachers and students in the school. After completing the survey, it can be concluded that most teachers and students admitted that it is difficult to use different applications to access materials and school assignments. Therefore, this application of material management, assignments, and grades needs to be designed to help teachers and students in learning activities - teaching in the school environment.
