ABSTRACT

OSS-RBA is a business licensing system developed by the Ministry of Investment/BKPM together with the Digital Business and Technology (DBT) Division of Telkom Indonesia with the aim of speeding up the business licensing process. The OSS-RBA system is a large-scale project and covers almost all ministries in Indonesia so that its development, both in feature development and bug fixing, requires a long process, starting from preparing business processes to checking quality standards for the features being worked on.

The process of quality standards testing in the development of a system is called Quality Assurance (QA), which is a testing process to ensure that the products that will go up to the OSS-RBA system comply with the requirements that have been set at the beginning. The QA process has a very important role in the process of developing a system, this is because the results of the tests carried out determine a system.

The testing process uses the International Organization for Standardization 9126 standard or usually called ISO 9126 standard by fulfilling the functional aspects of a system.

Keywords: ISO 9126, *quality standard testing, Quality Assurance* (QA), OSS-RBA
