

ABSTRACT

Tax Deduction is a feature in the Online Single Submission (OSS) application that is used to set the Return on Investment Period and Adjustment of Tax Holiday Tax Deduction Period. By using this feature, each Tax Holiday facility application that has other considerations can have its tax reduction value changed. Currently, the Online Single Submission (OSS) application still uses the default asset value matrix to determine a tax reduction value. This method causes problems when there are applications for Tax Holiday facilities that have other considerations. The purpose of this feature is to change the Tax Holiday tax reduction based on other considerations. This feature is built using the Node.js and Vue.js frameworks. Testing this feature with blackbox testing and usability testing shows that this feature runs according to the input.
