

ABSTRACT

This internship report discusses the development of an admin website called "My Tel-U Dashboard" on the frontend side which was carried out by the author during his internship at a technology company called PT. Main Data Adi. My Tel-U Dashboard is an information and management system application to make it easier for admins to process and make decisions from data that has been collected and grouped in such a way that it becomes interrelated and mutually supportive information. The aim of this project is to improve the user experience on the company's website by improving the appearance and interaction of the user interface. The author develops using the latest technologies such as HTML, CSS and JavaScript as well as several libraries and frameworks such as ReactJS and Bootstrap. The method used is to analyze an existing website, including needs analysis, interface design, implementation, and testing. The result obtained is a website that is more interactive and responsive with a more modern appearance and easy for users to use. In addition, the author also gains valuable experience in developing frontend websites which can be an important asset for future careers.
