

## ABSTRACT

---

*The rapid development of information technology today can increase efficiency and effectiveness in various things, one of them is in logistics management. By utilizing technology, the operational process in logistics management can be integrated, which will cause an increase of efficiency and productivity. Therefore, an application that functions as a platform that can integrate the companies involved in the logistics management process will be developed. These companies include logistics service provider companies, shipping companies, and delivery service provider companies. Not only that, but this application also provided with features that will make easier for users in terms of goods or product management, order shipment management, and invoicing in managing operational costs. With the development of this application, the operational process of logistics management, starting from the initiation to delivery process can be done optimally.*
