

ABSTRACT

NEW DESIGN OF HOTEL TRANSIT AROUND MINANGKABAU PADANG INTERNATIONAL AIRPORT USING SPATIAL PSYCHOLOGY APPROACH

Known for its cuisine, natural attractions, and even its residents who often migrate, Minangkabau International Airport is the transportation that is often used when visiting and leaving the city of Padang. The airport, which is located in the province of West Sumatra, has a high number of flights organized by the Minangkabau International Airport which has led to an increase in visitor arrivals to West Sumatra Province. However, the increase in arrivals and departures at this airport was not matched by public facilities and facilities around the airport, one of which was a transit hotel. Starting from the operating hours which are not 24 hours, the mood and mood of the visitors are different, the psychological conditions of the visitors are different, the facilities are inadequate and even the distance of public facilities that are the needs of visitors also makes the needs of visitors limited. The emergence of these problems is an urgency to implement transit hotels with a psychological approach to space around the airport by adjusting the psychology of visitors, visitor needs, and problems that exist around them. The aim is to provide comfort and provide a conducive resting facility for anyone who needs a transit hotel which of course adapts to the psychological condition of hotel visitors. Thus, the benefits obtained are not only for visitors who need them, but also for the city of Padang, which is helped by tourism, and even the good name of the city of Padang in the field of tourism.
