

ABSTRACT

A cart is a tool or medium used by people to move goods from one place to another. In Indonesia, carts have various types and shapes, depending on their needs and uses. One of them is a motorized cart, this cart is used by Indonesian people to go around carrying their merchandise when selling. However, itinerant traders have not thought about safety factors when using them. On the basis of the problem of the traders' lack of awareness of the safety of the cart, the researcher made a study of the design of the traveling meatball trader's cart using a qualitative method that aims to be a reference or recommendation for traders to be able to make trade carts with safety standards in accordance with regulations.
