Wood furniture MSMEs are a small micro business in Indonesia, they are a business that can produce production waste, in this problem, wood furniture MSMEs have concerns about the waste from their production, especially the wood shavings waste generated from wood shavings. In this study, researchers try to utilize wood shavings waste into a decorative home product so that it can become a useful material, the decorative product designed will be a product that has artistic value with a concept that contains natural elements. This research uses a qualitative research method with an observation approach and interviews with experts, and the design method used in product design uses the SCAMPER method by taking elements of substitute, adapt, and modify. The results of this study created a home decorative product that has natural elements with artistic value, with manufacturing techniques that adapt from incense making techniques. From this research, home decorative products from wood shavings waste material are also able to become a decorative product that emits a fragrant aroma, because basically wood shavings can absorb a fragrant liquid.
