Textile and Fashion Craft Study Program

Along with the times, technology in the textile industry has also developed, as can be seen by the development of the production process and the various types and characteristics of textile materials. From the various types and characteristics of materials available, their potential as embellishments for fashion products using mixed materials can be further explored and developed. One of the materials that can be used as raw material for mixed material processing is textiles, including satin, scuba, and organza. With different fabric characteristics, there is potential in processing mixed materials as embellishment with the inspiration of moon orchids. The moon orchid is one of Indonesia's national puspa, namely puspa pesona which has a distinctive shape so that there is an opportunity for the shape of the moon orchid as an inspiration for embellishment. This research aims to develop the potential of satin, scuba, and organza materials using mixed materials in 3D modular embellishment processing using textile techniques such as hot textile and surface textile with moon orchid inspiration to be applied to fashion products. This research was prepared using qualitative methods in the form of literature studies, observations, interviews, and explorations. It aims to optimize the development of mixed materials in making embellishment modules that will be applied to fashion products.

Keywords: Embellishment, mixed material, moon orchid.
