ABSTRACT

Yucoms application is an application that aims to facilitate employees and CEO of PT Yoriyusakifa Yuki Kompos in collecting compost sales data. In order to facilitate data collection and monitoring of compost sales. Because PT. Yoriyusakifa Yuki Kompos still uses paper and Microsoft Excel in terms of data collection of transactions. Where this is quite draining a long time in its implementation and has a large level of possibility of fraud, because employees can outsmart it. So we create a system where employees will input transaction data according to customer orders and if customers have not received receipts made by the Yucoms application, customers do not need to pay because it is certain that the employee has not input transaction data. The system development method used in the design of this Yucoms application is using the Agile Software Development method. The purpose of this Yucoms application is to provide convenience to PT Yoriyusakifa Yuki Kompos in monitoring compost sales data. Not only monitoring sales data in the Yucoms application, the CEO of PT Yoriyusakifa Yuki Kompos can record employees, customers, see monthly sales graphs, record transactions, record the results of compost usage, record operations, and confirm transactions made by employees.
