

## ABSTRACT

---

*The Goods Inventory application is a website-based application that is used to manage the warehouse owned by Ernov Bali, which includes incoming and outgoing goods. In this application, there are 3 users: administrators, warehouse Staf, and leaders. The main problem faced by warehouse officers is the difficulty of monitoring the stok of goods in the warehouse. To find out the stok of goods, the warehouse Staf must check the goods directly. Another problem is the difficulty of making incoming and outgoing goods reports. To reduce these problems, the goods inventory application is proposed. The workmanship method used in building this application is the Software Development Life Cycle (SDLC) waterfall model approach. This application has key features that can help the administrator record incoming goods and reports.*
