

ABSTRACT

With the development of data processing application technology, it is very potential to facilitate and meet the needs of the community in general and employees in a scope of work that requires applications as a means of support and can efficiently help improve service to consumers, cut time and of course increase profits. Roxy Pharmacy is one company that is trying to take advantage of this technological advancement. Some obstacles are often experienced by Roxy Pharmacy, one of which is that the company needs time to synchronize data because each branch has its own data base so that the data generated is not real time. Currently, Roxy pharmacies already have a Point of Sell application that is used to break the obstacles experienced so far. However, the application has not been able to display data and the amount of stock available in real time and has not been able to see the availability of stock of goods at other branches. Therefore, Roxy pharmacy tries to overcome some of these problems to adjust the needs of customers and the Roxy pharmacy itself, so a POINT OF SALES APPLICATION BASED ON THE ROXY PHARMACY WEBSITE was created.
