

ABSTRACT

Information System for Complaints of Violence Against Women and Children (SILARAS) is a website that aims to digitally record cases of violence against women and children. Because data collection on violence cases at Kesbangpol services is still done manually, a website is needed as a digital data collection medium so that the case resolution process is completed more quickly and case data is properly recorded.

The purpose of this Final Project is to make it easier for the Kesbangpol Service to record cases of violence that occurred in Pariaman City. The solution proposed in this Final Project is to build an Information System-based website with the selection of solutions using the software development life cycle (SDLC).

The results of the information system for complaints of violence against women and children will be demonstrated after being designed and developed, then it will be explained that every expected result in the information system for services for violence against women and children will be tested so that the implementation results are as expected.
