

ABSTRACT

Good Things Happen is a movement that is currently starting to grow bigger. At the beginning of the pandemic, this movement had a new idea for cosmetic donations that were no longer used and will distribute to several parties, such as foundations, body-makeup, and make-up classes for people with disabilities. Because this movement is currently developing and the donation transaction process, done manually through WhatsApp personal chats and Instagram direct messages, was deemed ineffective. So, build an application to help overcome this. An application with a clear donation transaction feature can see product needs and recap transaction data. In making this application, several tools were used, such as the PHP programming language to perform coding, MySQL database to accommodate transaction data, and HTML, CSS, and JavaScript scripting to build the front-end side. The result of this Final Project are in the form of user data recaps, transactions data recaps, donation reports, and articles.

Keywords: cosmetics donation, unused cosmetics, data recap
