

ABSTRACT

Guaranteeing the quality of a product or application is one of the duties of a quality assurance person. The quality in question is integration, functionality, performance, load or burden of the application, whether it has passed standard criteria or not. To guarantee the quality, testing is carried out by a QA.

There are 2 ways of testing that are usually carried out by QA, namely manual testing or automation. Based on software development that has a complicated application flow, and also on a large scale and requires efficiency in testing time, automation testing was chosen as an assistant in testing applications. It is hoped that automation testing will be implemented well in accordance with existing best practices and time efficiency.

Keywords: SQA, Automation testing.
