ABSTRACT

The development of technology has paralleled the evolution of time, significantly impacting industries and companies alike. Companies require technological integration to streamline their various business processes such as employee management, financial management, task management, and more. Before the advent of technology, these processes were handled manually, resulting in inefficiencies, scalability issues, tracking difficulties, among others.

Cloud-based Human Resource Information System (HRIS) applications offer several benefits to enhance these business processes. These applications provide services aimed at simplifying various aspects of business operations. The introduction of such applications is expected to expedite and optimize the business processes within a company, making them faster and more efficient.
