

ABSTRACT

The rapid development of internet technology, especially in the digital era, brings various benefits to people's lives. However, on the other hand, various new challenges and problems have also emerged, one of which is Cyber Gender-Based Violence (KBGS). KBGS refers to acts of violence that occur in the digital space, triggered by gender imbalance. This action can occur through various information and communication technology platforms, such as mobile phones, the internet, email, and social media.

One form of KBGS that often occurs is blackmail, which is blackmail with the threat of spreading personal photos/videos of the victim. Blackmail perpetrators use digital technology to intimidate and blackmail victims in order to gain profit or control over the victim. Women are the group most vulnerable to blackmail, with various negative impacts such as insecurity, shame, low self-esteem, and trauma.

This study was conducted to understand the phenomenon of blackmail as a form of KBGS and its impact on women. This study uses a qualitative method with a literature study.
