

ABSTRACT

One industry that is experiencing rapid growth is logistics and transportation due to technological advances. The problems being faced by the client are unscheduled order delivery, non-optimal route selection, and difficulty recording incoming messages. To overcome these problems, PT TransTrack designed an Order Planning application. This application is designed to help the process of planning and organizing orders for goods or products effectively and efficiently. This final project presents feature flows that are useful for the development and design of the Order Planning platform. This project uses the agile scrum method.

Keywords: scheduling, planning, order, recording, shipping.
