

ABSTRACT

Congestion is a common occurrence in several areas. One of the congestions that can be seen is in the Bandung area because of the large number of residents living there. Congestion occurs because of the large number of vehicles passing on a road but the available roads are not enough to accommodate the large number of vehicles. This can be seen from the phenomenon of congestion that occurs on Jalan Sukapura, on this road there is often congestion because of the large number of motorbikes. By conducting this research, we want to overcome the congestion that occurs on Jalan Sukapura, so that Sukapura road users and residents can feel comfortable. This is because motorbikes are practical and fast vehicles. In addition, one student said that using a motorbike to go to campus can make it easier but there will be costs incurred if using a motorbike. One solution to reduce congestion is to walk, but there are many obstacles that someone experiences when walking. A resource person said that if the destination is not too far away, it is better to walk to reduce the congestion that occurs on Jalan Sukapura. However, some argue that walking is very difficult, they feel hot and lazy to walk. In addition, most people are not used to walking to come to a closer place, so there needs to be awareness in oneself to get used to walking.

Keywords: traffic jam, motor vehicles, walking.
