

ABSTRACT

Technological developments in Indonesia which are expected to have a positive impact are misused by irresponsible parties, where the technology is used to facilitate a criminal act, namely online gambling. Gambling, which previously could only be done conventionally, is now easier due to advances in technology, you only need access to a laptop or smartphone and an internet network to play online gambling. The data results show that online gambling is very dangerous, because it can cause damage at the economic, social and mental levels of a person. Unfortunately, this does not affect the large number of online gambling players, from children to adults, this is due to a lack of understanding and easy access to online gambling. In this research, qualitative methods were used for data collection. The results of data analysis explain that an effective way to disseminate information is by providing education through digital media. So there is a need for effective educational media to prevent the spread of online gambling, which can be spread online, namely with infographic media via social media Instagram and other supporting media. It is hoped that these results can provide information that is easy for teenagers to understand about the dangers of online gambling so that teenagers avoid online gambling.
