

ABSTRACT

In the rapidly evolving digital era, service companies, including salons, face challenges in managing their operations and finances. One of the main issues is that transaction recording is still done manually, which carries a high risk of errors and hinders the smooth running of business processes. Based on these issues, a web-based application has been developed to assist in managing employee data, Chart of Accounts (COA), inventory, suppliers, assets and their depreciation, stock tracking, and the recording of inventory purchases. This application is also equipped with features to generate financial reports such as general journals, ledgers, and trial balances. The system development follows the waterfall method, which includes requirement analysis, system design, implementation, and testing. The tools used in the development include web-based frameworks and relational databases to ensure accuracy and ease of data processing. The results of this application development are expected to improve transaction recording accuracy, accelerate data management processes, and support data-driven decision-making that is faster and more precise for salon businesses.
