

ABSTRACT

Ida'z Crochet is a knitting craft shop that provides various crafts with original hand knitting. This shop has a manual recording of sales and purchases so that the resulting output seems messy and has the potential to cause miscalculations in the report. Therefore, this shop needs a system that can handle sales and purchases and provide an order or sales feature for customers who want to buy products easily online. This system can produce financial reports such as general journals, ledgers, sales reports and income statements which can help manage and monitor the structure of financial transaction activities at Ida'z Crochet. The development method used in this final project is Waterfall, with stages such as analysis, design, coding and testing. This system was developed using Laravel and MySQL as a database. The results of this test will show that the system can help Ida'z Crochet in recording sales and purchases easily, placing orders, and generating financial reports automatically.
