

Abstract

Hepatitis is a disease that attacks the liver. Ignorance often leads patients with hepatitis late to be addressed. At this time one should go to the hospital or doctor to find out information and circumstances. Not everyone is able to monitor the situation and its development independently. Therefore we need an alternative media to determine the state of a person who felt he was suffering from hepatitis.

In this final project, the application can help analyze the state of the patient and analyze the development of the situation of patient by the color of the eye sclera are applied on mobile technology.

This application has several main functionalities health checks, medical records, information, and reminders. Applications built using the Java programming language, interface design using Photoshop and XML, and SQLite database.
