

## ABSTRACT

MMS (Multimedia Messaging Service) is a *messaging service* which is message not only based on text but based on multimedia that have capability to send multimedia message in once time. Multimedia message can be a text, audio, color picture, and also video. All of them send in one packet in MMS format.

MMS can be expand to be an application to monitoring server performance in a certain network, which is the purpose of this service is to help network administrator to monitor server performance without their present in the server room. This MMS service is chosen as a media to access the server because of the ability to show text, audio, color picture, and also video.

To make it realize therefore in this Final Project it will be posted an software application based on MMS, which is later can access the server to require information about server performance. It is easier to analyse graphic picture than text.
