

ABSTRACT

At this moment the Internet technology has already growth and become a part of life. The Internet technology expansion has been influence the wireless communication, that the Internet user can access this services trough the cellular phone.

The fast moving of mobile Internet technology is supported by General Packet Radio Services (GPRS), the new generation of GSM, which is used to wireless data services such as wireless Internet or intranet also support multimedia services. The benefit of GPRS technology is the user can be connected or always online, but the cost is depend on the size of transmitted data. With GPRS, the voice call can be done together with data transmit ion. GPRS is a new additional service on the existing network. Thus, the operator can share competitive services for data exchange to complete the establish services.
