Abstract

Expansion of technology right now produce result telecomunication devices for human need. That media must be can communicates fast, efficient, and correct. For example, there is mobile phone, fax, email, etc that can be used customer for communnicate right now.

Because the telecomunication devices can transmit data or message in different format, so there is a application to bridge that difference, so that telecomunication devices can be transmit data or message in different format without any problems.

In this final project will build and implement aplication to bridge a mobile phone with MMS with email, so that transmit data to each other.

The final project will be implemented by gateway and mail server. The gateway provide communication between application and MMS network. And mail server provide communication between application and email
