

Abstract

In this Globalization era, information is really needed by everyone. Almost all sector in this human's life need information.

When you search document (using a search engine), sometimes there are some troubles in the process. For example, user use a simple query (too general), so user cannot get the right result (the document what user want). This causes an information retrieval system not so efektif. There is time when a search engine which can add its original query needed. This final project will explain about some search engine's methods for adding its original query, especially about pseudo-relevance feedback.

This final project will explain about the benefits and the weakness of pseudo-relevance feedback's method. This method will be compared with the standart method (brute force). Brute force is included in pseudo-relevance feedback's method. There are two searches in feedback's method, the first one is a trial. How long (time) the process of this method is depend on the additional words.

Keywords: *query, search, information*
