

PERFORMANCE ANALYZE OF LOCAL TELECOMMUNICATION NETWORK IN KANDATEL TANGERANG

ABSTRACT

With the increasing needs of communication, operators with excellent telecommunication network that can accomodate users' demands are badly needed. To improve the quality of work of telecommunication networks, we need some parameters that can assess the quality.

This work assessment for a telecommunication network, can't be assessed by only one parameter instead. We need some more parameters that can be standard of the network's performance, to find out whether it is good or bad.

Probably, the condition that we find in the field will be much different from what we expect ideally. However, with the assessment on some network parameters we can make some improvements in order to get the ideal condition. Therefore, the telecommunication network will work better and eventually it will give more benefits for the operator as the telecommunication server itself.
