

ABSTRACT

All communication, for example radio communication either broadcast, point to point or cellular communication, antenna has important function. Antenna functioned on the end of the transmitter and in front of receiver, so that information transmitted is heard than received by receiver. Antenna function in matching intrinsic impedance of propagation space on the characteristic impedance of channel of radio frequency electromagnetic.

This project aims to the *Design and Realization of 2-Wire Triangle Ditunggal Antenna with a Toroid 100 Ω and Minimum Frequency 1000 MHz*. Triangle Ditunggal Antenna is wire this antenna by matching of triangle gradual for wide band with $VSWR \leq 1,5$ on minimum frequency 1000 MHz. The design of this antenna aims to get the specification frequency $\geq 1000MHz$, unidirectional polarisation, linear polarisation, gain $\geq 2,14dbi$ and used female SMA connector

As transmitter antenna has to radiated or transmit direct electromagnetic to enable the transmitted information by the receiver, as well as the receiver can receive or called the electromagnetic wave on the free space transmitted by the transmitter antenna.

Key word : antenna, frequency, toroid matching, triangle gradual matching.
