ABSTRACT

Desa Binaan is a program which is initiated by Badan Eksekutif Mahasiswa KBM IT Telkom for developing a village to be a self reliant village. Actually, village has many potencis, for example middle little business enterprise potency, education potency, nature beautifull potency, etc. Desa Binaan is hoped be able to be an accelerator to realize an independent of Indonesia. So, it's needed a method to inform about it to public people, because it can share information, discuss about something, and also inform desa binaan.

Designed system is a website of information system whish has several things, they are desa binaan profile, news, activities scedhule, programs, gallery photo, contact us. This website not only tell about desa binaan, but also can be an method to share information with the facilities, they are forum and shout box.

The output of result which got is a dynamic website of information system Desa Binaan KBM IT Telkom and can repair older manual system. This website is examined by two methods, the first is subjective and the second is performance. There are two parameters to examine performance this website, they are time response and speed to load the website using campus network with the different time.

Keynote: Desa Binaan, website of information system, sharing information, examining website.
