

ABSTRACTION

Expanding the Information of Technology gives a lot of benefit to people and the information management, keep in mind that the information has to move quickly and on time to users, so the information is not become worn out.

To a workgroup that has high complexity and intensity in its activity, the traffic of information cannot be endured with only to conventional ways and become more physical characteristic. It can hamper velocity in create its purpose that has be planned in vision and mission by the organization.

As same as Construction Training Office in Jakarta and Repair shop and Instrumentation Office that include in technical implementer unit in Construction Industry Training, Ministry of Settlement and Infrastructure. It means both of that inter unit carry out the job to propose a labour in construction service sector to have access in instruction market and having ability to compete in instruction market either in national or international.

Remember the job that carried out, the communication media cannot rely on the conventional ways, because the construction technology development and the training technology keep on going, so data communication inter unit will be more effective and efficient, if it is conducted with using LAN, so that everyone from inter unit can be communicated in the matter of many things that interrelated with Construction Technology, Training Technology and Human Resources in Construction Service Sector. For that purpose, a model choosen in network construction become important focus in having a cost and optimum benefit.
