

ABSTRACT

The information about loss vehicle data organizing was used to help reporting process to people who experience those cases. Managing the information was often late, because the process was done manually.

In this final project was built web base software to support CURANMOR information system which case study was took in Polres Cimahi Bandung. Because at this moment loss vehicle data organizing process was still had complicated procedure, where data recording was done manually on book.

With this software, it will be easier for Polres to organizing data which form is report from people and also the newest information about the loss vehicle. Beside that, people can use this information system to find out the progress of the cases.

This final project was built using object oriented method. Database of this project was built using MySQL. PHP and Apache was used for the web application.

Keywords: CURANMOR, *Object Oriented*, Database..
