

Abstract

In this final project, a software of resident census is built which is expected to help the Badan Pusat Statistik (BPS) of West Java to get the resident census data. This software has the ability to provide resident data information that can be used by the society. The resident census process itself is done periodically, every ten years. Commonly, the process is done in the subdistrict. This resident census software is built using PHP 5, Apache 2, and MySQL 5 as data storage.

Keyword : Resident data , PHP, Apache and MySQL.
