

ABSTRACT

Devices and mobile technology are interesting phenomenon in the end of the last century and this phenomenon influence many business way. One example of mobile devices is cell phone. Mobile technology enables us to communicate with others through short messages, everywhere and every time. Our daily activities are felt easier with this technology. Integration between computer technology and mobile devices produce fast and easy messaging with powerful data processing. And this final project uses the advantage of this technology integration in conjunction with increasing service for the customers of Regent Theatre through Short Message Service (SMS) based ticketing order.

This final project is using Java and PHP as core programming language, SQL Server as a database server and Apache as a web server. The method that is used to develop this final project is a structured method and Waterfall modelling as system development approach.

This final project can serve ticketing order through SMS at Regent Theatre. The admin and operator can manage data, do administrative task and create reports.

Keywords: Ticketing order, SMS, Theatre.
