

Abstract

Internet Café is a business place which sells internet services. Nowadays there are lots of internet cafes exist to fulfill people's need in information enquiries. One of the functions that needed in this business is a billing application that is used to count how long users have used the internet and how much the users have to pay. Most of applications which exist now are desktop application. There is a lack in these applications which can not be used in different operating systems, and these applications have to be installed in every computers will be used. Therefore, an application that can handle the lacks from desktop application.

In this final project, a web application has been implemented. The advantage from this is that this application can be used by many users only by install web browser application in every computer which will be used. In this application, the main module is billing module, while the finance module and member module only as a supporting module. This application is made using PHP for scripting and MySQL as the database.

This application can do count of billing. This application can handle data bilik (like little room), configuration cost, and control transaction of billing that happen too.

Keywords : Billing Application, web, PHP, MySQL.
