

## ABSTRACT

The key to success in learning, work, or achieve something is by setting a good time and planning. Time can be an problem if not used properly or it could be a tremendous asset if you can arrange it by wisely. If we are very busy or filled with a series of tasks , we would probably create a task list / to-do-list / task list so that we remain organized and tasks can be completed according to the schedule. In essence, whatever we do, create a task list is always a good way to achieve focus

In general, create a task list is still made by hand, which is recorded a list of tasks that we will do on a paper. Testing time is also done manually so that it becomes less effective, especially for a fairly complex tasks. Another way is to use stand alone software on the PC. However, this still has shortcomings because we have to remain on the PC where we store the task list to check. More difficult problem comes when the task that we will do is the job of a team or come into contact with more than two people for same task

Therefore , we build an application that can provide ease of management task list / to-do-list as easy to write on a paper. Web-based application is created so that users can access the to-do lists that have been made during any access to the Internet. Applications are also required to be able to add more than one user for a task similar to tasks in the form of teams can also be managed properly.
