

Abstract

Sankuriang International is an Information Technology (IT) company at Bandung. It is founded since 2006 and now has more than 50 employee and 3 branch office.

The old attendance system at Sangkuriang International has already uses a computerized system. Each coming employee will be recorded at the attendance system by logging in usig the system, and when work is over they will log out from the system. Salary that the employee will receive is a sum of total work hours that has been recorded in the system multiplied with the salary per hour according to the agreement. This calculation still done manually though. Monthly salary report to that company directors is also done manually. The old system does not provide report about total salary, work hours, and project allocation that can be accessed by employee , project leader, or admin.

The would be built system will help all element of the company in completing their work. For example, helping admin on salary report and monitoring the employee work hours. The system will provide employees the ability to check their own salary and print it out directly. It will also help the directors to check monthly reports.

This system will be built using PHP programming language and use MySQL Database. This system will also be built inside a PHP framework called Zend.
