

ABSTRACT

At the present time so many companies and medium entrepreneurs that do business via the Internet for example to \$sale or purchase of goods sold or transaction concerned with the business. It shows that the technology at the present time growth more rapidly in the presence because of an Internet media that can help improve business in selling a good product that are marketed.

Any company or entrepreneur must be wanted to improve quality in selling a product that is marketed for example their goods / products sold out quickly. To overcome, it is needed a media interface (website) to market their product faster in sales transactions via on-line primarily to customers who is located far away with the entrepreneurs who sell these products and also provide information about their products. On the other hand it also save costs and time to buy goods / products sold by these companies or employers.

Because of that reason, this final project is tried to built an application of mobile phone selling products which is based on web (case study at Ozzy counter). Beside that website that will be built/construted containing informations of the mobile phone will be sold. The entrepreneur(Ozzy counter) before don't have any website to sell mobilephone only once they use phones(for customer that their location are far or the can't come to the counter) to buy mobile phones.

To built this selling application of mobile phone based on web(case study ozzy counter) writer are using waterfall method and implemented using programming language such as PHP and used MySQL for database and other supporting applications.

Key words: website, waterfall, PHP, MySQL
