

ABSTRACT

4848 travel agency is a company engaged in the sector of transport services, especially in the travel and freight delivery. To make ticket reservations, people must visit the corporate office directly. This method has many weaknesses, such as limitation of place to make an order ticket, so the buyer from different regions has a lot of trouble to use services in this travel agency. To solve this problem, we need a web-based ticket reservation application, which is able to handle transaction management bookings and generate sales reports per month. Web-based application was chosen because it has many advantages. Such as easy to access and can extend the range of ticket reservations. This application was built using waterfall process model, implemented with the programming language PHP, MySQL databases and other supporting software.
