

## **ABSTRACT**

For developing and make the ordering easily in a restaurant, and in order to simplify and make good estimate time in ordering food, therefore it is needed an application that is able to manage the current activity of ordering food and drink.

This Final Project with title “Building an Ordering Food Application in Fast Food Restaurant Based on Android (Case Study : Rumah Makan Dapur Bebek)” possess an ability to handle the food ordering. Just like a commonly food ordering, it could give the estimation of cost in a single or more order. Beside that, this application uses Wifi Technology, so monitoring for current ordering could be served with the right order of costumer. .

There are several main fungsions of this application, such as input new orders, view ordering that already exist,and view the total payment. This application used Java and PHP programming languages, design interface using XML, and also MySQL database.
