ABSTRACT

An election or general election must be held in a specified period on a democracy state. In this case, the role of the community is very large, therefore the application to display the results of a general election expected to rapidly meet the need for it.

The final project is designed with title "The Quick Count Result Viewer Application in Real Time Web Based using Android as Data Input Device" has a functionality to display the results of an election in a specific area quickly and accurately. There is a wide range of innovations in applications such as the use of android media as data input device.

The programming language used is CI or Code Igniter to build web-based applications, and the Java-based Eclipse to build Android applications.
