

ABSTRACT

Along with the development of technology, trigger high levels of consumption in Indonesia so that it becomes a consumptive msyarakat. Currently the mall is a destination for shopping. There are many stores that offer a variety of needs and many shops selling the same goods so un tuk to know the price of the corresponding p [engunjung must visit each store one by one. If viewed in terms of time, it is ineffective and inefficient. If seen from power, it will require more power. Therefore, they invented an alternative to assist people in finding stores that sell the desired visitors.

Application of "one stop shopping portal" is an application built with multiple functions such as providing information on goods that can be purchased at BIP mall, as well as the location of the selling price of the goods. This application is a web-based sevice that is divided into two parts, among others, the android as a client and a web server. Application of "one stop shopping portal" is built using the Java programming language, PHP, and to view using XML and CSS.
