

ABSTRACT

Web-based applications have been widely applied in the areas of governance, one of them a web-based application that helps in the management of community grants. In making the application Provider Community web-based live help writers doing research at BKM Al Muamalat. The application using the programming language PHP and MYSQL as its database and method development using models of the waterfall.

The utilization of information technology in bkm al-muamalat still is very low, a system of data on this bkm only limited on the software microsoft word and microsoft excel, which is still less able to manage data and information to the coordinator bkm itself and the society. From the premise above, then built application management direct aid the community (case study BKM Al Muamalat) which are expected to help the process of the process of public assistance so that information about public assistance can manage with much better.

Conclusions after making the "*Aplikasi Pengelola Bantuan Langsung Masyarakat Berbasis Web BKM Al-Muamalat*" is the application can supports data management and handle data storage and reception of proposals as well as showing the program which is being or has been conducted.
