

Abstract

One source of state revenue by approximately more than 75% comes from taxes. Income tax is one tax that is charged to every person who works in Indonesia.

At the tax office is part of the process data representative account tax payments are still processing data manually to get information on the development and comparison of tax payment tax payment of taxpayers. Of the manual processes still relies less applicable and the perceived job becomes less effective and efficient.

The data processing will be more applicable to a web-based applications, with a representative form with a blend of text, graphs, and tables that support and facilitate the performance of employees in the existing data processing to produce a more valuable information.

Web-based application is an application that uses the content of electronic media with the help of the internet or intranet to use all the functionality contained in the application with the goal of adding income taxes and penalties.

Of the problem is hence made an application for data management oversight of tax payment. That in making use of the programming language PHP and the MySQL database to manage and Adobe Dreamweaver CS3 for writing editor program.
